

KEEP YOUR COOL

Energy Saving Tips for Office Air Conditioners

- Keep cool air in by closing doors and windows when the air conditioner is on.
- Strategically position blinds and drapes to block the warm sun and keep the office cooler.
- Set the thermostat at the warmest comfortable setting. Remember, setting the thermostat at a colder setting when you first turn on the air conditioner will not cool the office any faster, but can lead to excessive cooling and wasted energy.
- Avoid using space heaters that force the the air conditioner to work harder.
- If possible, turn off the air conditioner at the end of the work day.

ENERGY STAR® qualified room air conditioners use at least 10% less energy than conventional models. Replacing a central air conditioning unit that is more than 12 years old with an ENERGY STAR® qualified model could cut your cooling costs by 30%.
